

We flipped the ask.

Transparency isn't a feature.

It is the architecture.

EVERYONE ELSE

data → ranking → *trust us*

data + hidden weights = forced ranking

OURS

decision → iteration → *insight*

THE PROBLEM

Every ranking hides a choice.

Current tools produce a list and ask you to trust it. Or visualize data.

Every ranking has a bias.

No iteration, no suggestion, no comparison!

THE REAL QUESTIONS

Whose values produced that #3?

What if yours are different?

How do we improve?

INVERSE WEIGHTING

YOUR INPUT

"I want to prioritize water scarcity problem in Afghanistan"

OUR PRODUCT

Finds the feature weighting that ranks Afghanistan accordingly with transparent, editable scoring criteria

OUR OUTPUT

✓ **Strengths in your criteria**

And why?

✗ **Weaknesses in your criteria**

And suggestions

The question isn't which country ranks first. It's under which values?

DEMO

Better transparency
Better adjustability
Better insights
